

# OSSES ASSIGNMENT ON RTOS

## Morse-based Twitter

**Massimo Violante**

Politecnico di Torino

Dip. Automatica e Informatica

# Goal

- The goal of this lab is implementing a Morse-based Twitter
- The system sends Tweets composed of maximum 140 characters
  - For the sake of simplicity we assume only uppercase characters
  - Numbers and punctuation characters are not allowed
- The systems sends a pre-defined set of messages, one after the other
  - Each message is sent (possibly multiple times) for a duration of 180 seconds
  - After 180 seconds since starting displaying a message, the display is interrupted for 0.5 seconds, and then the display of the next message is started
- The pre-defined messages are (from Fortune Cookie):
  - A FEATHER IN THE HAND IS BETTER THAN A BIRD IN THE AIR
  - A SHORT PENCIL IS USUALLY BETTER THAN A LONG MEMORY ANY DAY
  - ACCEPT SOMETHING THAT YOU CANNOT CHANGE AND YOU WILL FEEL BETTER
  - ADVENTURE CAN BE REAL HAPPINESS
  - ALL THE EFFORT YOU ARE MAKING WILL ULTIMATELY PAY OFF

# Goal

- Remember that
  - The dot is coded as symbol “1”
  - The dash is coded as symbol “111”
  - A pause “0” shall be inserted after each symbol
  - After each codeword an inter-codeword pause shall be inserted, corresponding to “000”
  - After each word, an inter-word pause shall be inserted, corresponding to “0000”
  - Each bit (“0”/“1”) shall be displayed on a LED (or using printf)
  - The bit timing is 100msec
- Propose a suitable architecture for generating the needed bit timing, the message timing, and implement the embedded system using either OSEK (EE VM, or EE Arduino, or Trampoline) or Micrium  $\mu$ C/OS-III

# Evaluation criteria

- The evaluation is based on the following criteria
  - Max 15 points: the solution shall provide the requested behavior
  - Max 9 points: code complexity (the simpler, the better)
  - Max 6 points: memory occupation (the least, the better)
  - Extra bonus, max 3 points: hardware implementation
    - As making the code running on hardware is more complex, 3 extra points will be granted to the solutions running correctly on Arduino or FRDM K64

# Deliverable

- The code you developed:
  - If based on Micrium you shall deliver app.c
  - If based on OSEK you shall deliver OIL file and C file
- 2-page report describing your work in PDF format
- The files shall be delivered using “portale della didattica/elaborati” as a single ZIP file
- Deadline 18/12/2020 24:00
- The assignment shall be delivered by both Mechatronics and Computer Engineering students
  - CE students will have to deliver a second work covering the 2-extra credits (more details next)
